Brain Damage in the Preterm Infant (Clinics in Developmental Medicine):

This Clinic in Developmental Medicine describes a meticulous survey of germinal matrix intraventricular haemorrhage in preterm infants. The babies weighed 501-2000g at their birth in three New Jersey counties between 1984 and 1987. They were studied prospectively with cranial ultrasound; the findings were correlated with very detailed pathological examination of the brains of those who died and with later outcome in the survivors. The numbers studied in this population provides real insight into the neuropathology and makes meaningful correlations with clinical and especially with ultrasonographic findings. The neuropathology is beautifully presented in a systematic and comprehensible form that even clinicians would appreciate.
